

PROJECT DEMONSTRATION

Personalized Networking Assistant

▶ 00:00

A Streamlit and FastAPI application that turns an event description and a user’s interests into personalized conversation starters, while also supporting fact checking, feedback storage, and conversation history.

PRESENTED BY PUNA

The project is framed as a practical networking helper: enter the context, add your interests, and receive topics or questions you can use in conversation.

WHAT THE APP DOES

Four capabilities form the product loop

▶ 00:13

The demonstration repeatedly returns to the same loop: generate suggestions, let the user react, verify a topic, and keep the record for later review.

1

Personalized conversation starters

The app analyzes an event description together with user interests, extracts important topics, and generates tailored conversation suggestions.

2

Fact check summary

A user can enter a topic and request a fact check; the demo shows a short summary such as Python being a popular technology topic.

3

Feedback collection

Users can like or dislike generated suggestions, and the app stores recent feedback for display.

4

Conversation history

The system keeps the event description, interests, extracted topics, and suggestions as a conversation record.

BUILD AND STRUCTURE

A modular Python project split by interface, API, services, models, and tests

▶ 00:38

Frontend

Built with Streamlit and responsible for user interaction.

Backend

Built with FastAPI and exposed through REST APIs.

Services

Contains the business logic behind generation, fact checking, feedback, and history.

Tests

Written using pytest for backend APIs and services.

Python

Streamlit

FastAPI

REST APIs

JSON files

pytest

GitHub repositories

Epic 1 / Epic 2 folders

DEMO PATH

From event context to stored history

▶ 03:01

The live walkthrough shows the user entering a conference scenario, generating suggestions, checking a topic, and then reviewing feedback and history.

Input

Enter an event description.

Interest

Add personal interests that should shape the suggestions.

Generate

Click to produce relevant topics and conversation prompts.

React

Like or dislike generated suggestions as feedback.

Review

Open fact check, feedback history, and conversation history.

EVENT DESCRIPTION

A conference on Python and machine learning

USER INTEREST

Python and machine learning

The example is simple, but it makes the core behavior clear: the same terms in the event and interest fields become the basis for generated networking prompts.

GENERATED DIRECTION

Topics: Python and machine learning

Example prompt: “How did you get started with Python?”

A related prompt around industry or learning more about Python and machine learning is shown in the demo.

The fact-check panel is demonstrated with the topic “Python,” returning a short summary that Python is a popular technology topic. ▶ 04:31

PERSISTENCE AND APIS

The app records feedback and exposes the main functions through FastAPI

▶ 06:07

Feedback history

User likes and dislikes are stored in a JSON file and displayed as recent feedback history.

Conversation history

The app keeps the conference context, interests, extracted topics, and generated suggestions together as a history item.

REST API coverage

The backend handles conversation generation, fact checking, feedback collection, and conversation history through FastAPI endpoints.

TESTING AND REPOSITORY VIEW

The walkthrough ends by showing JSON files, pytest coverage, and GitHub repositories

▶ 07:41

After demonstrating the application flow, the presenter opens the stored JSON files, refers to backend APIs and services tested using pytest, and shows GitHub repositories organized around Epic 1 and Epic 2.

Bottom line

The project successfully demonstrates a personalized networking assistant that generates conversation starters, performs a basic fact-check workflow, stores user feedback, and maintains conversation history.
